MONOLITHIC

Independent verification for AI and technical claims

Matthew Chenoweth Wright
Founder & CEO, Monolithic LLC

Investor & partner presentation / October 2026

The gap between a claim and a decision

A benchmark score or a passing build can leave the central claim untested.

The buyer’s question

“What can I actually rely on?”

NIST’s AI RMF calls for documented, repeatable evaluation and ongoing risk review.

The product is an inspectable answer

One claim. One version. An agreed scope.

A written report connects each finding to its evidence, assumptions, and next test.

Finding	Meaning within the agreed scope
PASS	The performed check supports the claim
FAIL	The performed check contradicts the claim
UNRESOLVED	Required evidence or work remains missing
N/A	The check does not apply

Target customers and buying triggers

Initial buyer	Buying trigger	First engagement
AI software teams	A release or enterprise diligence request	Evaluate one workflow claim against a baseline
Formal methods teams	A proof package or a promoted theorem	Review assumptions, build, and claimed scope
Technical investors and partners	A consequential technology decision	Commission a bounded second opinion

Entry strategy: sell a small, decision-relevant review, then expand only where the evidence warrants it.

Ramtastic: defects beyond the proof

RAMTASTIC / FROZEN-RELEASE REVIEW

84

tracked files
individually hashed

A reproducible release build failure

Two concrete specification defects

Exact counterexamples and a separate diagnostic build

Public work sample. Findings apply to the pinned release, not an endorsement or a customer relationship.

Weaver OS: external technical engagement

17

Lean declarations in Weaver OS’s EFMW-inspired core

12 recurrence results
5 modeled authorization results

Monolithic’s review traced the source, assumptions, and recorded build evidence.

External technical uptake and attribution. Broader deployment, safety, and performance claims remain separate.

A portfolio of inspectable research

585

source statements retained and classified in one Lagrangian audit

The transferable capability

Pinned definitions and sources

Formal checks with explicit assumptions

A recorded boundary between verified results and open claims

EFMW remains a research program. The audit capability is the commercial focus.

Pricing and engagement scope

Engagement	Price / labor cap	Scope
Scoping engagement	$500 fixed price	Up to 5 active hours Evaluation plan
Initial assessment	$150 cap	Up to 1 active hour
Focused audit	$450 cap	Up to 3 active hours
Repository review	$900 cap	Up to 6 active hours

Hourly work: $150 per active human hour, within the agreed cap.
Execution after scoping is quoted separately.

A path to recurring verification

CURRENT OFFER

Paid scoping and bounded technical review

PROPOSED EXPANSION

Reuse proven checks across releases.
Package recurring verification only after repeat demand.

Milestones for commercial validation

Public work samples and a defined offer are in place.
Paid demand is the next validation step.

Proposed milestone	Evidence of progress
First paid scope	Signed scope and payment
Independent rerun	A reviewer reproduces a bounded result
Paid execution	A buyer accepts the agreed evidence package
Repeat engagement	A buyer commissions another release or claim

Founder-led research and delivery

Matthew Chenoweth Wright

Founder & CEO, Monolithic LLC

Researcher, author, and software builder
Creator of the EFMW research program
Public technical work under @enuminous

Remote delivery, with scope, findings, and follow-up in writing

The next partnership

A paid pilot around a consequential technical claim

The partner brings a frozen artifact, a decision, and a technical owner. Monolithic brings a scoped investigation and evidence another reviewer can inspect.

Matthew on X: @enuminous

Public work: github.com/enuminous/papers

Selected evidence and scope notes

Audit services and published terms

Commercial offer; terms do not establish revenue

Ramtastic audit, pinned report

Historical release findings and diagnostic-build distinction

Weaver OS residual-core review

External artifact; source and recorded CI review

EFMW-Lagrangian audit

585 classified statements and explicit physical obligations

NIST AI RMF Core

Voluntary risk-management and evaluation context
